Chapter 1

REPL

Listing 1.1: C++ code using listings

```
1
      #include <stdio.h>
2
      #include <stddef.h>
3
      #include <stdint.h>
      #include <stdlib.h>
4
      #include <string>
5
6
      #include <sstream>
      #include <iostream>
8
      #include <functional>
      #include <tuple
```

Listing 1.2: C++ code using listings

```
1
                 int main(int argc, char* argv[])
 2
 3
                          REPL repl;
                           \begin{array}{lll} \texttt{repl.run} \, (\,[\,] \,(\, \texttt{auto} \, \, \, \texttt{str} \,\,, \,\, \, \texttt{auto\&} \, \, \, \texttt{ss} \,) \,\,\, \{ \\ & \texttt{if} \,\, (\, \texttt{str} \,\, = \,\, "\,. \,\, \texttt{exit"} \,) \,\,\, \texttt{return} \,\,\, -1; \end{array}
  4
 5
 6
                                    else
  7
                                    {
                                              ss << "Unrecognized command ["
 8
 9
                                                    << str << "]";
10
                                              return 0;
11
12
                           });
13
                           exit (EXIT_SUCCESS);
14
                           return 0;
15
```

Listing 1.3: C++ code using listings

```
using PREPLCallback = int(
1
2
            const std::string&,
3
            std::stringstream& ss);
4
        using REPLCallback = std::function<PREPLCallback>;
        class REPL
5
6
        {
7
        public:
8
            REPL():
9
                in(std::cin),
